

DISTRIBUTION OF FAT MASS IN YOUNG TYPE 1 DIABETIC PATIENTS

Y.V. Dydyshko, A.P. Shepelkevich

Department of Endocrinology of the Belarusian state medical university, Minsk, Belarus

OBJECTIVES

There is convincing evidence that the increasing of visceral fat is a risk factor for vascular disease. Type 1 diabetes mellitus (T1DM) is characterized by the development of micro-, and later, and macrovascular complications

The aim of the study was to examine features of body composition fat distribution parameters in T1DM patients.

The research involved:

- ✓ Anthropometry of patients
- ✓ General clinic examination
- ✓ Dual energy X-ray absorptiometry (Body composition program)
- ✓ Fat mass distribution research was based on Total Body, Android, Gynoid, A/G Ratio, Trunk/Total, Legs/Total (Arms+Legs)/Trunk parameters.

METHODS

96 patients with T1DM (59 women, 37 males) and 54 (30 women, 24 men) controls matched for age, sex and body mass index were examined (Table1)

Table 1 - Clinical and laboratory characteristics of the examined patients with T1DM and control subjects

Characteristic	T1DM patients	Controls	р
Sex, w:m	59:37 (61%:39%)	30:24 (56:44%)	
Age (yrs)	31,76 <u>+</u> 8,21	29,90 <u>+</u> 6,43	0,28
Height, sm	166,31 <u>+</u> 7,04	167,08 <u>+</u> 5,03	0,60
Weight, kg	64,13 <u>+</u> 9,85	62,37 <u>+</u> 9,05	0,41
BMI (kg/m2)	23,14 <u>+</u> 2,88	22,31 <u>+</u> 2,90	0,21
Waist, sm	76,29 <u>+</u> 5,72	71,00 <u>+</u> 5,83	0,08
Disease duration (yrs)	13,45 <u>+</u> 7,52		
Age of T1D onset (yrs)	18,50 <u>+</u> 8,09		
НвА1с	8,57 <u>+</u> 1,22	5,02 <u>+</u> 0,27	< 0,001

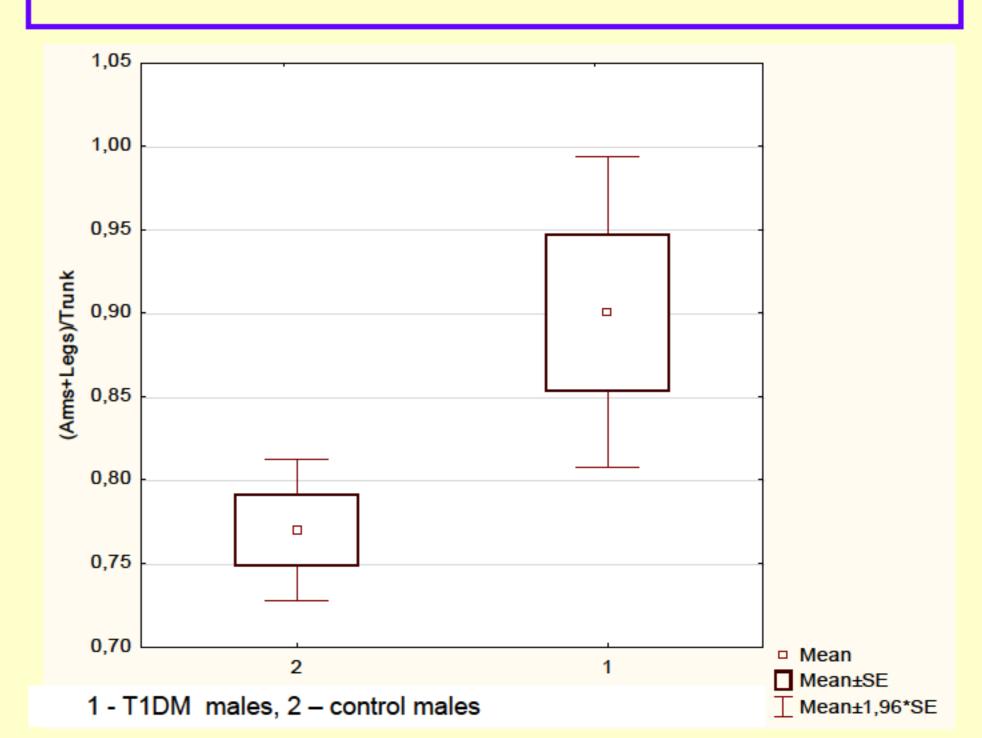

Data are expressed as mean SD and %.

RESULTS

✓ Lean mass parameters in T1DM males and women compared with controls were:

Region	women		р	men		р
	T1DM patients	Controls		T1DM patients	Controls	
Android fat,%	32,29 <u>+</u> 8,44	32,37 <u>+</u> 10,81	0,97	27,41 <u>+</u> 11,43	28,8 <u>+</u> 9,67	0,627
Gynoid fat,%	41,72 <u>+</u> 6,63	41,36 <u>+</u> 7,16	0,81	28,06 <u>+</u> 7,15	26,74 <u>+</u> 7,74	0,506
A/G Ratio	0,76 <u>+</u> 0,14	0,45 <u>+</u> 0,05	0,97	0,95 <u>+</u> 0,24	1,06 <u>+</u> 0,15	0,048
Total Body,%	33,25 <u>+</u> 6,7	32,3 <u>+</u> 7,59	0,102	23,02 <u>+</u> 7,9	22,55 <u>+</u> 7,5	0,551
Trunk/Total	0,44 <u>+</u> 0,048	0,45 <u>+</u> 0,056	0,611	0,516 <u>+</u> 0,07	0,54 <u>+</u> 0,034	0,094
Legs/Total	0,412 <u>+</u> 0,05	0,415 <u>+</u> 0,054	0,812	0,35 <u>+</u> 0,06	0,32 <u>+</u> 0,032	0,093
(Arms+Legs)/T runk	1,18 <u>+</u> 0,25	1,17 <u>+</u> 0,3	0,837	0,9 <u>+</u> 0,28	0,77 <u>+</u> 0,105	0,034

Gynoid (peripheric) fat distribution was positively correlated with the age of T1DM males (r=0.19; p=0,018), however no correlation was found with the duration of the disease, level HbA1c, the total daily insulin dose.

CONCLUSIONS

The peripheral type of fat mass distribution is dominated at T1DM males compared with healthy males, while there were no differences in the distribution of adipose tissue among the investigated women.

The obtained data indicate gender differences in the distribution of fat mass in T1DM patients.
