TOPIC: MALE HYPOGONADISM

## INTRODUCTION

Congenital hypogonadotropic hypogonadism (CHH) is a rare disorder. It can be sporadic or familial and is divided into anosmic hypogonadotropic hypogonadism (Kallmann syndrome - KS) and congenital normosmic isolated hypogonadotropic hypogonadism (idiopathic hypogonadotropic hypogonadism - IHH). A growing number of genes are involved in its etiology, suggesting the heterogeneity and complexity of this condition.

## CASE REPORTS

	PATIENT 1	PATIENT 2	PATIENT 3	PATIENT 4	PATIENT 5	PATIENT 6
	Kallmann Syndrome			Normosmic isolated hypogonadotropic hypogonadism		
				Familial		Sporadic (Acquired?)
SEX	Male	Male	Male	Male	Female	Male
AGE AT DIAGNOSIS	18y	18y	13y	22y	18y	28y
CLINICAL MANIFESTATIONS	<b>Delayed Puberty</b> <ul style="list-style-type: none"> <li>Sparse body hair</li> <li>Small testis (R 9x10x11mm, L 10x11x12mm at ultrasonography)</li> <li>Small penis (45mm)</li> </ul> <b>Cryptorchidism</b> (orchidopexy at 5 years old).	<b>Delayed Puberty</b> <ul style="list-style-type: none"> <li>Sparse body hair</li> <li>Small testis (R13mm, L12mm at ultrasonography)</li> <li>Small penis for age</li> </ul> <b>Gynecomastia</b> Other medical conditions <sup>†</sup>	<b>Delayed Puberty</b> <ul style="list-style-type: none"> <li>Sparse body hair</li> <li>Small testis (R 12x5x11mm, L 15x7x9mm at ultrasonography)</li> <li>Small penis for age</li> </ul> <b>Cryptorchidism</b> (right orchidopexy in 2008)	<b>Delayed Puberty</b> <ul style="list-style-type: none"> <li>Sparse body hair</li> <li>Small testis (R=L 5mL)</li> <li>Penis: 70 mm</li> </ul>	<b>Primary amenorrhea</b> → Patient 4 Sister	<b>Gynecomastia</b> <ul style="list-style-type: none"> <li>Since 14 years old (stable)</li> <li>No other symptoms</li> </ul>
SMELL	Anosmia	Hyposmia	Anosmia	Normal	Normal	Normal

GENETIC TEST	Negative*	Negative*	Negative*	<b>GNRHR gene mutations: c317A&gt;G8 (exon 1) and c.937_947delTTTTTAAACCC(exon 3)</b>		Negative*
TREATMENT	Testosterone Enanthate (250mg i.m. monthly)	Testosterone Enanthate (250mg i.m. 3 in 3 weeks)	Testosterone Enanthate (250mg i.m. 3 in 3 weeks)	Testosterone Enanthate (250mg i.m. monthly)	Estradiol Valerate + Norgestrel (2mg/0,5mg)	Testosterone Enanthate (250mg i.m. monthly)
FOLLOW-UP	Improvement of sexual characters (6-12 months after starting treatment)	Improvement of sexual characters	Complete virilization	Patient had one child during treatment with testosterone (HH reversal)	Referenced for infertility consultation: planning pregnancy	↑ muscle strength <b>Family History of Breast Cancer</b> <ul style="list-style-type: none"> <li>Genetic screening: positive<sup>‡</sup></li> <li>Prophylactic bilateral mastectomy (histology: no malignancy)</li> </ul>

<sup>†</sup> Other medical conditions: bilateral deafness, congenital cardiomyopathy, cognitive impairment, thyroid papillary carcinoma.

\*Genetic test performed for *KAL1*, *FGFR1* and *GNRHR* genes.

<sup>‡</sup>Mutation carrier in heterozygosity of *BRCA2* gene mutation: c4808delA (p.Asn1603ThrfsTerm14) in exon 11.

## CONCLUSION

Although the cases presented share the main manifestations of CHH, each one has specific characteristics demonstrating the heterogeneity of this condition. They also highlight how diagnosis can be challenging, sometimes delayed to adult age, because distinction from constitutional delay of puberty may be difficult.
