TITLE

Congenital adrenal hyperplasia – natural history of the disease – very late diagnosis in a series of patients.

Urszula Ambroziak¹, Anna Kępczyńska-Nyk¹, Krystian Jażdżewski², Tomasz Bednarczuk¹

OBJECTIVES

Inactivating mutations of *CYP21A2 gen* cause deficiency of 21-hydroxylase of various degree, what leads to impaired cortisol synthesis, corticotrophin stimulation and accumulation of cortisol precursors that are diverted to sex hormones. CAH SW is usually diagnosed early in neonatal period due to clinical symptoms of salt loss in both sexes, CAH SV usually in early childhood with symptoms of precocious puberty and growth acceleration. NCCAH symptoms develop usually after puberty.

The aim of our study was to present a series of patients with adult diagnosis of classical CAH in terms of clinical presentation, hormonal tests, adrenal and gonadal imaging as well as genetic findings.

METHODS

Six patients (F=3,M=3) with adult diagnosis of classical CAH were qualified to the analysis. CAH was diagnosed based on serum 17OHP confirmed by urine steroid profile made by GC/MS-SIM. Genetic analysis was made by direct sequencing of *CYP21A2* gene.

Patients characteristics consisted of clinical data, metabolic and hormonal assessment, adrenal CT/MR imaging, testicular ultrasound and semen analysis in men.

RESULTS

Table 1. Characteristics of women with CAH

Diagnosis	SVCAH	SVCAH	SVCAH
Age at diagnosis (yr)	18	65	35
BMI (kg/m²)	33.6	24.8	20
Height (cm)	150	153	146
HOMA-IR	2.78	2.6	8.30
Co-morbidieties	No	No	Liver cirrhosis
Menstrual history	Primary amenorrhoea Virgo	Primary amenorrhoea, Menopause, Virgo	Primary amenorhhoea Virgo
F-G score	16	12	4
Genitalia	Clitoromrgaly	Clitoromeraly	Urogenital sinus
Alopecia, Acne	NO	NO	NO
Adrenal gland imaging	Normal	Bilateral adrenal tumors (Right- 45x30x37 mm, Left18x14x11mm (20- 30 HU)	Right adrenal tumor 85x57x70 mm, unhomogenous, without signal loss in MRI out-of- phase
Testosterone nmol/l (0.29-1.67)	9.9	5.15	27.90

CONCLUSIONS

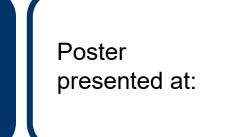

Delayed diagnosis of classical CAH in patients in advanced age is possible.

Males with hypogonadotropic hypogonadism, adrenal tumors and short stature should be evaluated towards CAH.

Women with primary amenorrhoea and adrenal tumors should be evaluated towards CAH.

The assessment of cortisol reserve in manadatory in case of adrenal incidentaloma,
elevated ACTH level and no clinical data for hypercortisolism
